Stream: Whiskey Creek
Tributary to: Sprague River> Williamson River
Survey Type: ODFW Stream Habitat
Access: Canoe to mouth, then foot
Reach: 1 Hess Reach
Start Survey: T36S-R11E-S12SE
Quad: Beatty
Date Surveyed: 20 August 04
Surveyors: R. Nawa, K. Hartzell
Report: R. Nawa, C. Huntington
Distance Surveyed: 0.6 km

Valley and Stream Channel Geometry

The stream was incised in a low lying meadow adjacent to the Sprague River. Two adjacent interconnected channels were dry. During high spring flows, lower Whiskey Creek is comprised of several anastomosing channels (distributaries) that flow into the Sprague River (See USGS Beatty 7.5 quad map). Moderate sinuosity (1.6) was accompanied by very low stream gradient (0.08%). Low terraces sloped gently to constrain narrow floodplains adjacent to the 1.3 m wide creek. The channel appears incised at U19. A 0.05 m high bedrock step at the beginning of the reach (U4) probably prevents further downcutting.

Substrate

The streambed was very fine textured. An estimated 95 percent of the streambed was sand/organics, two percent gravel, and two percent bedrock.

Spawning Gravel

A 3 m² patch of gravel near the mouth of the stream was not counted because it was 90% dry and 90% fine gravel (5-15 mm diameter).

Riparian Vegetation

No shade was recorded because grass and sage brush dominate the riparian zone. Lush grass along streambanks appeared to have no current livestock use (Photo 124). About 16 percent of streambanks were actively eroding. Channel incision contributed to the severity of eroding streambanks.

Wood

No wood was found in the channel because there are no trees on streambanks.

Rearing and Adult holding Habitat

Extremely low stream gradient caused the stream to be mostly pools (20%) and glides (73%). Maximum pool depths averaged 0.5 m deep. Glides averaged 0.2 m deep. Streamflow was nearly intermittent at the upper end of reach (U23-U25).

Stream Temperature

High summer stream temperature (23.5°C) reduces potential for salmonid rearing.

has resulted in 100%
eroding streambanks.
Channel appears incised.

Stream: Whiskey Creek
Tributary to: Sprague River > Williamson River
Survey Type: ODFW Stream Habitat
Access: Foot
Reach: 3 Smith Reach
Start: T36S-R12E-S19NW
Quad: Beatty
Date Surveyed: 19 August 04
Surveyors: R. Nawa, K. Hartzell
Report: R. Nawa, C. Huntington
Distance Surveyed: 2.6 km

Historical Background

Long time residents V. Smith and B. Topham reported to us that ground water pumping in the Sprague Valley reduces flows at local springs along Whiskey Creek. Rainbow trout historically spawned at springs along Whiskey Creek (e.g., springs in section 13 at U9, Photo 107). In recent years, flows from springs are inadequate to support potential spawning trout. Abundant willows once supported beaver along Whiskey Creek in reach 3.

Valley and Stream Channel Geometry

The beginning of the reach was dominated by a 2.7 ha beaver pond (U1-U5; Photo 103). (The active beaver dam is located on B. Topham's property below the beginning of the survey.) From U2 to U9 the stream was in a marsh with saturated, mucky soils bordering the stream for up to 30 m. Above U9 the creek was in a heavily grazed pasture that ranged from 200 m to 600 m wide. Moderate sinuosity (1.5) was accompanied by very low map measured stream gradient (0.08 %). Low terraces sloped abruptly to constrain narrow floodplains adjacent to the 1-5 m wide creek. The channel is vulnerable to downcutting. Active downcutting and channel widening was apparent at U15 and U20 (Photo 114).

Substrate

The streambed was very fine textured. An estimated 99 percent of the streambed was sand/organics with only one percent gravel.

Spawning Gravel

A 14.5°C tributary spring flows for 60 m to join Whiskey Creek (U9 map, Photo 107). A total of five m^2 of spawning gravel was found in this spring-fed tributary. Gravel was in small patches $<1 m^2$. A larger patch of gravel at the spring source was 1-2 cm gravel. Flows at this spring were very low compared to the high water mark on boulders along bank. Gauge height at the spring was 0.70 m.

Riparian Vegetation

Grass dominates the riparian zone. Occasional willows are dying back and in poor vigor. Cattle grazing along saturated floodplains has created patches of bare soil and hummocks of grass and sedges in the lower portion of the reach (U2-U9). Existing grass cover is inadequate to stabilize streambanks. About 24 percent of streambanks were actively eroding. Shade from terraces averaged only one percent.

Wood

No wood was found in the channel because there are no trees on streambanks.

Rearing and Adult Holding Habitat

Extremely low stream gradient caused the stream to be mostly pools (82%) and glides (17%). The beaver pond was 0.9 m deep. Maximum pool depths above the beaver pond averaged 0.7 m. Glides averaged 0.4 m deep.

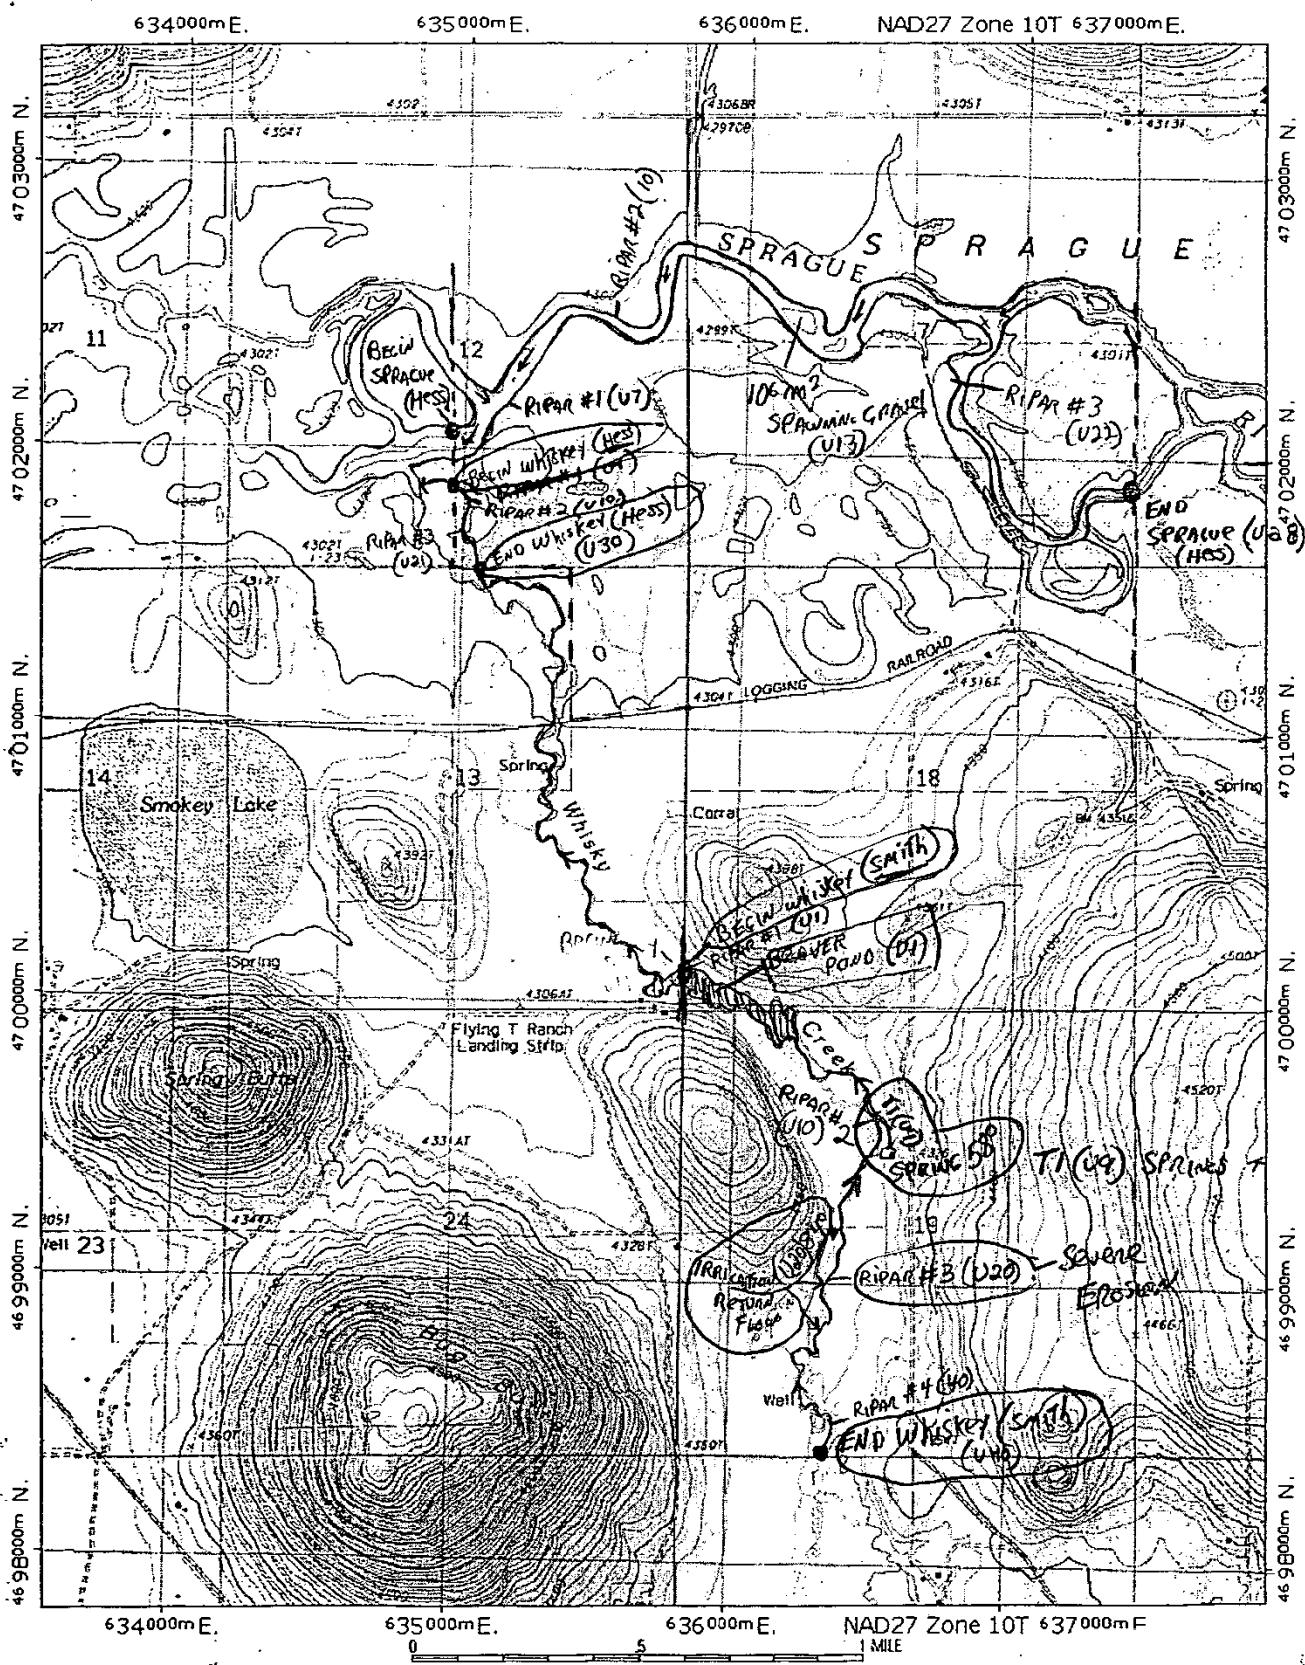

Stream Temperature

The beaver pond at U1 was 23°C at 1130 pdt. A 14.5°C spring-fed tributary (U9) cooled Whiskey Creek to 24.5°(1330pdt). Above the spring, the maximum spot stream temperature was 29°C at 1610 pdt. Warm 29-31°C water flowed into Whiskey Creek mainstem from flood irrigation at U20.

Photo 103 Unit 1
A 2.7 ha beaver pond/marsh dominated the lower portion of the reach. Note lack of rushes and trampled sedges above fenceline where reach begins.

Photo 107 Unit 9
A 60 m long
springbrook (14.5°C)
had 5 m² of spawning
gravel. Low flows are
attributed to ground
water pumping.

Photo 114 Unit 20
Despite riparian fencing,
the channel is widening
and downcutting resulting
in severe streambank
erosion.
